Extraction of Keywords and Summarization of Chairman Speech on Annual Reports

Synopsis:

Annual reports contain information about the performance of the organization in the previous financial year and every annual report contains chairman's speech where the chairman gives a brief about the performance of the organization and some direction along which the organization is planning to move. The crux of the report may be understood by looking at the keywords and they can be extracted automatically by training a Named Entity Recognition (NER) model based on transformer architecture. This project involves text annotation and subsequent training of a custom NER model to identify the keywords mentioned in the chairman's speech. Later the same model will be tested on other textual reports to see its efficacy and subsequent fine tuning requirements. Along with this, a summarization model will be used for the purpose of summarizing the organization's report/chairman speech which would help an investor to be efficient in getting insights and having a deeper understanding of an organization's performance, further assisting in decision making.
